

Myriophyllum aquaticum (Parrot Feather Water-milfoil)

Predicted Suitable Habitat Modeling

Distribution Status: Potential

State Rank: [SNA](#) (Regulated Plant)

Global Rank: [GNR](#)

Modeling Overview

Data Source Last Updated: Not Applicable

Model Produced On: October 29, 2021

Deductive Modeling

Modeling Process, Outputs, and Suggested Uses

This is a simple rule-based model for aquatic invasive plants that have invaded Montana or have the potential to invade Montana using wetland and hydrographic features from National Wetland Inventory Mapping and the National Hydrography Dataset. The rules applied were as follows:

- Include modern National Wetland Inventory mapped wetland areas for:
 - Palustrine systems with Permanently Flooded or Intermittently Exposed water regimes
 - Lacustrine systems (Limnetic and Littoral) with Permanently Flooded or Intermittently Exposed water regimes
- Include National Hydrography Dataset features for:
 - Reservoirs, Lakes, Ponds, Rivers and large Streams
- Exclude the interior limnetic areas of Flathead Lake, Canyon Ferry Reservoir, and Fort Peck
- Exclude any features above 7000 ft (2135 m) in elevation

This underlying vector model is available up request. However, for compatibility with other predictive distribution models the Montana Natural Heritage Program produces, we have intersected these features with a uniform grid of hexagons that have been used for planning efforts across the western United States (e.g. Western Association of Fish and Wildlife Agencies - [Crucial Habitat Assessment Tool](#)). Each hexagon is one square mile in area and approximately one kilometer in length on each side. Any hexagon that intersected a wetland or hydrographic feature described above was classified as suitable habitat. Model outputs are not evaluated and we suggest they be used to generate potential lists of species that may occupy lands within each hexagon for the purposes of landscape-level planning. Model outputs should not be used in place of on-the-ground surveys for species and wildlife and land management agency biologists should be consulted about the value of using model output to guide habitat management decisions for regional planning efforts or local projects. See [Suggested Contacts for State and Federal Natural Resource Agencies](#) attached to this document.

Deductive Model Map Output

Figure 1. Deductive habitat suitability model summarized into hexagons at a scale of 259 hectares per hexagon.

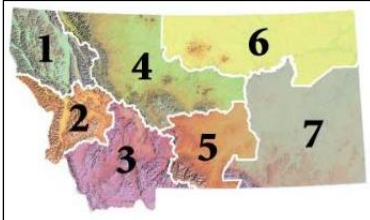

Suggested Contacts for Natural Resource Management Agencies

As required by Montana statute ([MCA 90-15](#)), the Montana Natural Heritage Program works with state, federal, tribal, nongovernmental organizations, and private partners to ensure that the latest animal and plant distribution and status information is incorporated into our databases so that it can be used to inform a variety of permitting and planning processes and management decisions. We encourage you to contact state, federal, and tribal resource management agencies in the area where your project is located and review the permitting overviews by the [Montana Department of Environmental Quality](#), the [Montana Department of Natural Resources and Conservation](#) and the [Index of Environmental Permits for Montana](#) for guidelines relevant to your efforts. In particular, we encourage you to contact the Montana Department of Fish, Wildlife, and Parks for the latest data and management information regarding hunted and high-profile management species and to use the U.S. Fish and Wildlife Service’s [Information Planning and Consultation \(IPAC\) website](#) regarding U.S. Endangered Species Act listed Threatened, Endangered, or Candidate species.

For your convenience, we have compiled a list of relevant agency contacts and links below; check [our website](#) for updates.
